

Song Classification for Dancing

**Manolis Cristodoukalis,
Costas Iliopoulos, M. Sohel
Rahman, W.F. Smyth**

Classical Pattern Matching

- Input: A text $T = T[1..n]$, A Pattern $P = P[1..m]$, both over the alphabet Σ .
- Output:
 - Whether P occurs in T
 - If yes, then the set $\text{occ}(P) = \{i \mid T[i..i+m-1] = P\}$

Example – Pattern matching

Pattern P = AAGCTA

Text T = CAAGCTAAGCTAC

Pattern

A	A	G	C	T	A
---	---	---	---	---	---

A	A	G	C	T	A
---	---	---	---	---	---

Text

1	2	3	4	5	6	7	8	9	10	11	12	13
---	---	---	---	---	---	---	---	---	----	----	----	----

C	A	A	G	C	T	A	A	G	C	T	A	C
---	---	---	---	---	---	---	---	---	---	---	---	---

$\text{Occ}(P) = \{2, 7\}$

Our Case

- Input:
 - Text → A musical Sequence
 - Pattern → Rhythm
- Output:
 - Slightly different from Classical PM
 - A 'extended/modified' notion of PM

Musical Sequence

- A string $t = t[1]t[2]...t[n]$
 - $t[i] \in \mathbb{N}^+$
- Example:
 - $[0, 50, 100, 200, 250, 300, 350, 400, 500, 550]$
 - Significance: Sequence of events!

Musical Sequence

- A string $t = t[1]t[2]...t[n]$
 - $t[i] \in \mathbb{N}^+$
- Example:
 - $[0, 50, 100, 200, 250, 300, 350, 400, 500, 550]$
 - Some (musical) event occurs at 0 ms

Musical Sequence

- A string $t = t[1]t[2]...t[n]$
 - $t[i] \in \mathbb{N}^+$
- Example:
 - $[0, 50, 100, 200, 250, 300, 350, 400, 500, 550]$
 - Some (musical) event occurs at 0 ms
 - Some (musical) event occurs at 50 ms

Musical Sequence

- A string $t = t[1]t[2]...t[n]$
 - $t[i] \in \mathbb{N}^+$
- Example:
 - $[0, 50, 100, 200, 250, 300, 350, 400, 500, 550]$
 - Some (musical) event occurs at 0 ms
 - Some (musical) event occurs at 50 ms
 - Some (musical) event occurs at 100 ms
 - And so on...

Musical Sequence

- [0, 50, 100, 200, 250, 300, 350, 400, 500, 550]
- Alternative Representation (We use)
 - [50, 50, 100, 50, 50, 50, 50, 100, 50]
 - Significance: Sequence of “duration” of the events!

Musical Sequence

First Representation

50

Duration of First Event = $50 - 0 = 50$

Musical Sequence

First Representation

$$\text{Duration of Second Event} = 100 - 50 = 50$$

Musical Sequence

First Representation

Duration of Second Event = $200 - 100 = 100$

Musical Sequence

First Representation

Alternative Representation

Rhythm

- A string $r = r[1]r[2]\dots r[m]$
 - $r[j] \in \{Q, S\}$
 - Q means a quick(er) event
 - S means a slow(er) event
 - S is double the length (duration) of Q
 - Exact length of Q or S is not a priori known

New Notion of Match

- Let $Q \equiv q \in \mathbb{N}^+$
- Then $S \equiv 2 \times q$
- Q matches $t[i..i']$ iff
 - $q = t[i] + t[i+1] + \dots + t[i']$
 - $1 \leq i \leq i' \leq n$
 - If $i = i'$ then the match is **SOLID**

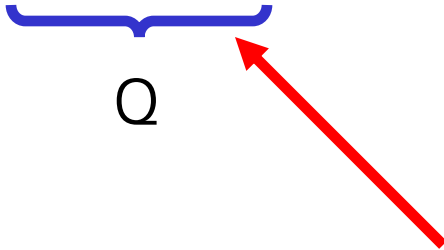

New Notion of Match

Let $q = 150$

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

Q

$$50 + 100 = 150 = q$$

New Notion of Match

Let $q = 150$

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

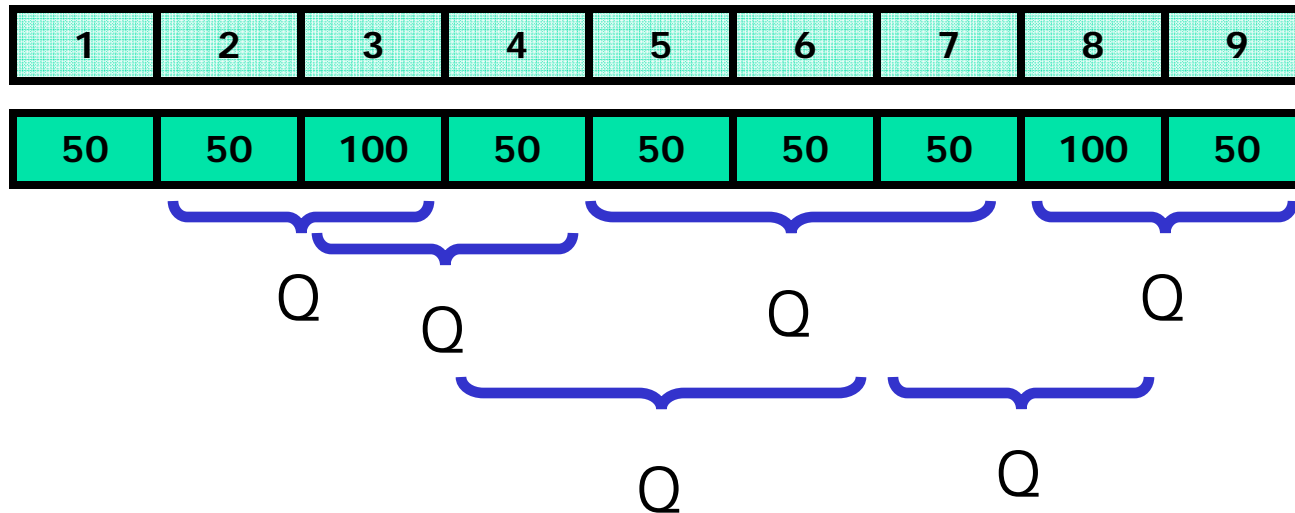

Q Q

$$100 + 50 = 150 = q$$

New Notion of Match

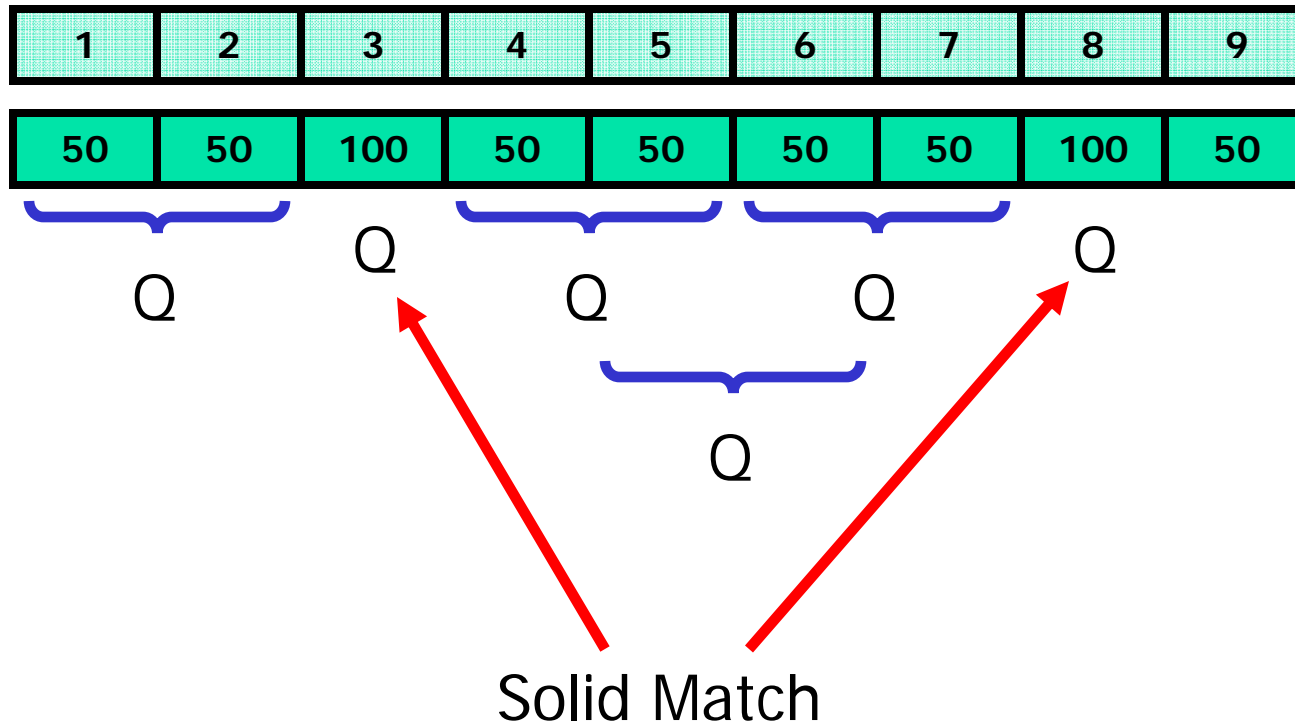

Let $q = 150$

New Notion of Match

Let $q = 100$

New Notion of Match

- $S \equiv 2 \times q$
- S matches $t[i..i']$ iff either of following is true:
 - $i = i'$ and $t[i] = 2q$ (SOLID)
 - $i \neq i'$ and there exists $i \leq i_1 \leq i'$ such that
 - $q = t[i] + t[i+1] + \dots + t[i_1] = t[i_1+1] + t[i+1] + \dots + t[i']$
 - $1 \leq i \leq i' \leq n$
- So, S is either solid or a tile of 2 consecutive Q 's

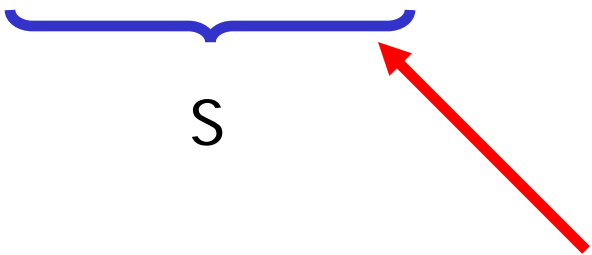

New Notion of Match

Let $q = 100$, then $S \equiv 2q = 200$

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

S

$$t[1] + t[2] = 100 = t[3]$$

New Notion of Match

Let $q = 100$, then $S \equiv 2q = 200$

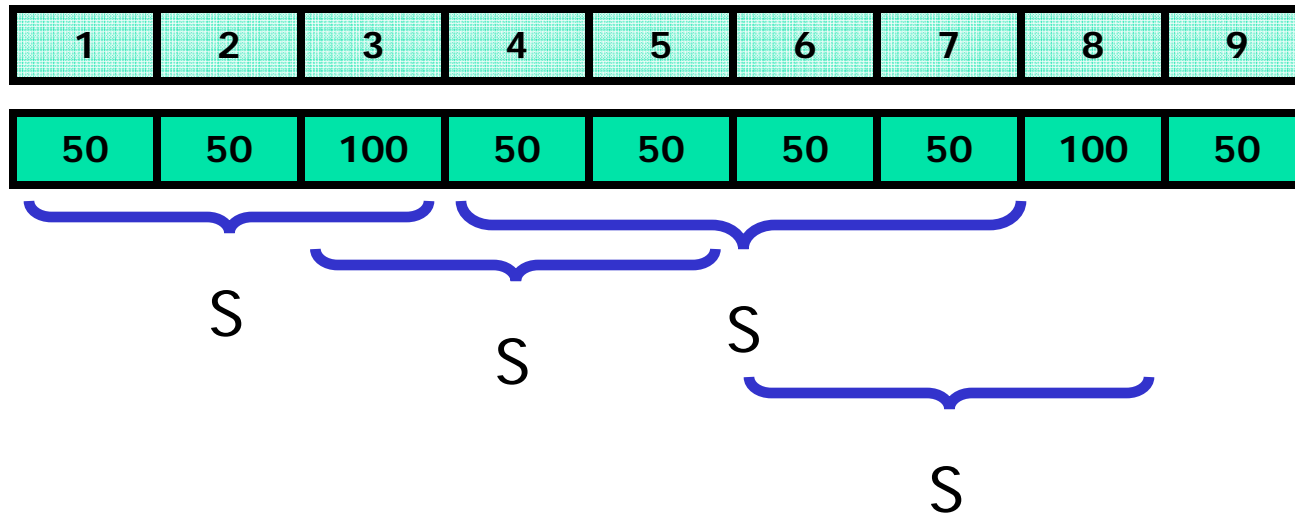

$$t[4] + t[5] = 100 = t[6] + t[7]$$

New Notion of Match

Let $q = 100$, then $S \equiv 2q = 200$

New Notion of Match

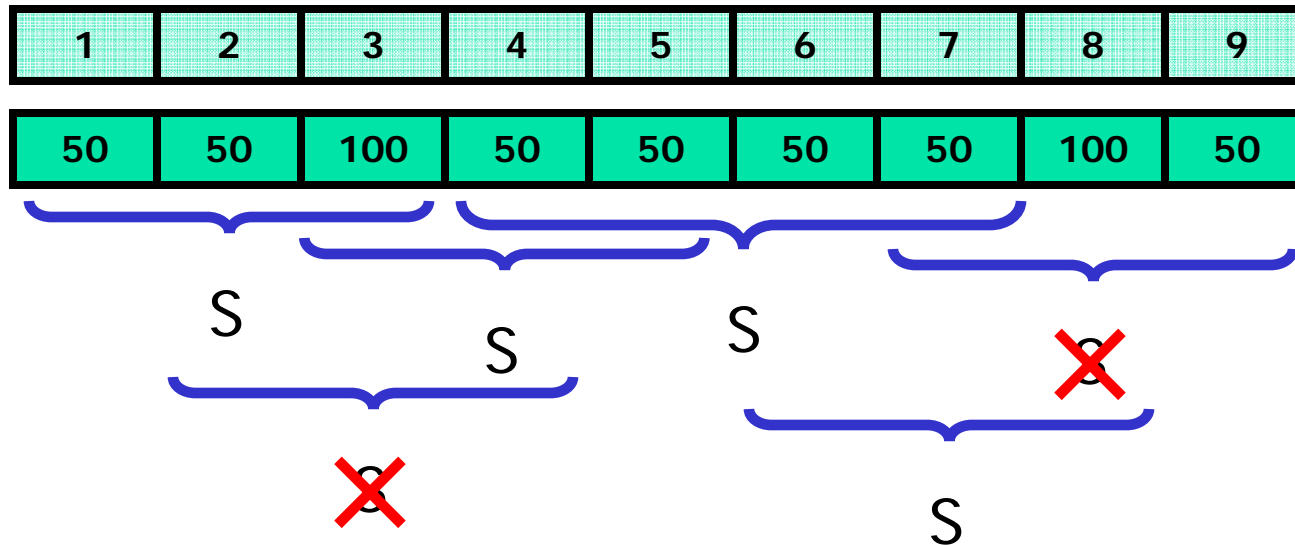

Let $q = 100$, then $S \equiv 2q = 200$

Although, $t[2] + t[3] + t[4] = 200 = 2q$

New Notion of Match

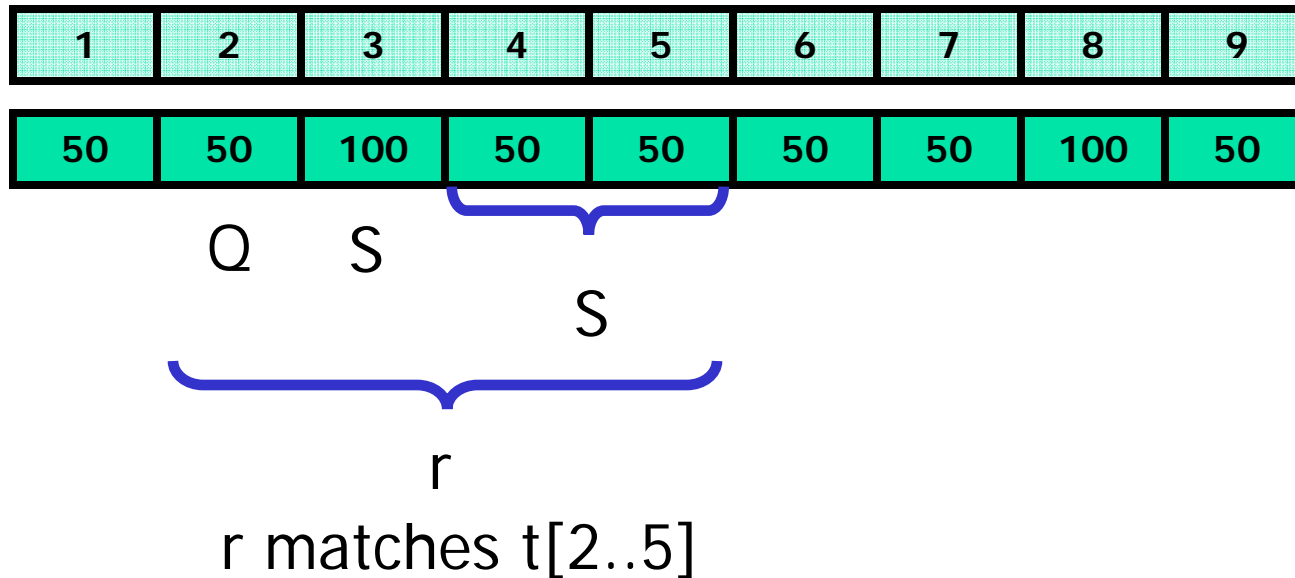

Let $q = 100$, then $S \equiv 2q = 200$

New Notion of Match

Let $r = \text{QSS}$ and Let $q = 50$

New Notion of Match

Let $r = QSS$ and Let $q = 50$

Q

S

Q

S

S

S

r

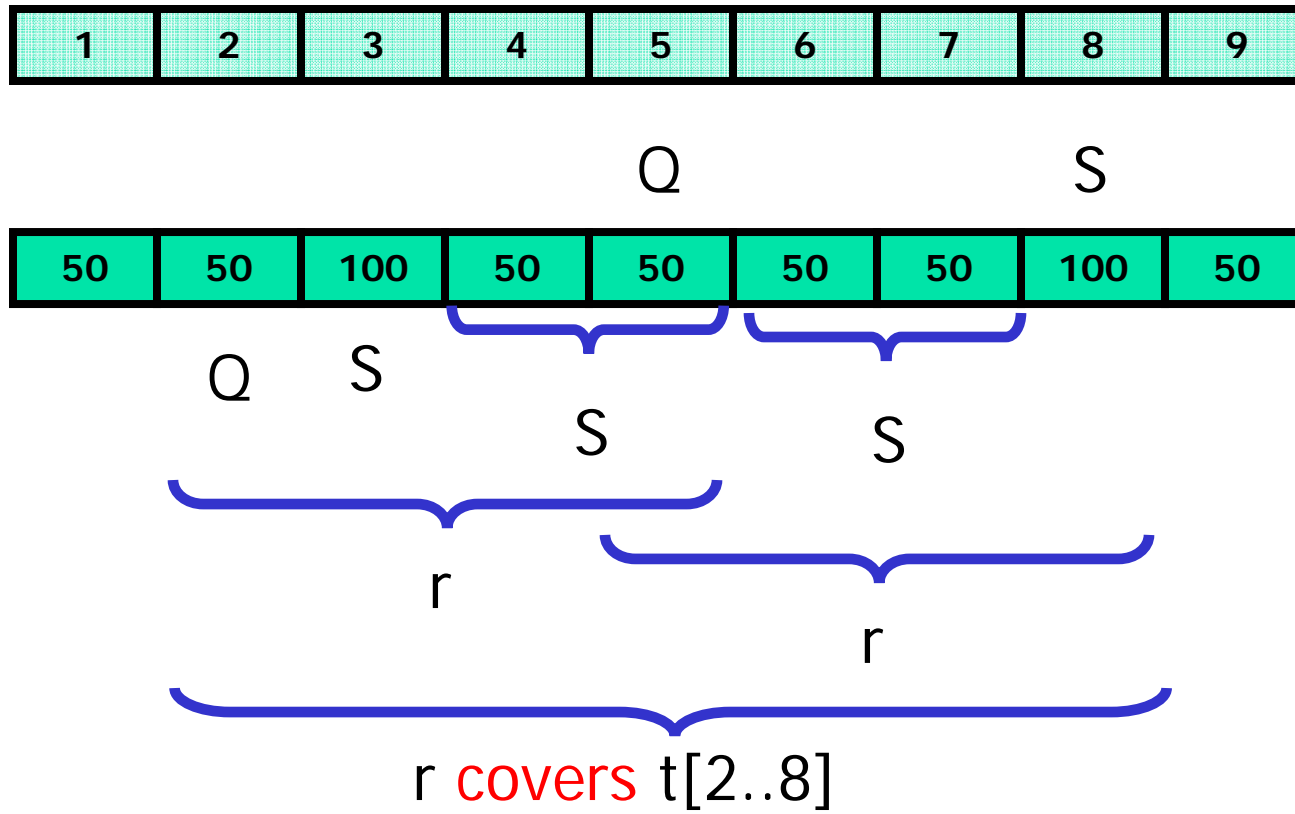

r

r matches $t[5..8]$

New Notion of Match

Let $r = QSS$ and Let $q = 50$

Our Problem

- Input:
 - A musical Sequence t
 - A rhythm r
- Output:
 - The longest substring $t[i..i']$ that is covered by r

Restriction

- For each match of r , at least one S must be solid

Let $r = QSS$ and Let $q = 50$

Restriction

- For each match of r , at least one S must be solid

Let $r = QSS$ and Let $q = 50$

At least one S must be Solid ~~✗~~

Restriction

- For each match of r , at least one S must be solid

Let $r = QSS$ and Let $q = 50$

Motivation

- Our aim is to classify music according to dancing rhythm
- Music seq can be considered as a series of events corresponding to music signal S
 - Drum beats
 - Guiter picks
 - Horn hits

Motivation

- The intervals between these events characterize how the song is danced
- Basically two dancing rhythms: Quick & Slow
- Example:
 - cha-cha \equiv SSQQSSSQQS
 - foxtrot \equiv SSQQSSQQ
 - jive \equiv SSQQSQQS

Motivation

- So solution to our problem can classify songs according to dancing rhythms!

Algorithm

- Stage 1: Find all occurrences of S for a chosen value $\sigma \in \Sigma$ such that $\sigma/2 \in \Sigma$.
- Stage 2: Transform areas around each S into sequences of Q .
- Stage 3: Find the matches of r and consequently the cover.

Algorithm: Stage 1

- We construct two arrays:
 - $\text{first}[1..|\Sigma|]$: $\text{first}[\sigma] = i$ iff the first occurrence of symbol σ appears at position i .
 - $\text{next}[1..n]$: $\text{next}[i] = j$ iff the next occurrence of symbol at $t[i]$ appears at $t[j]$.

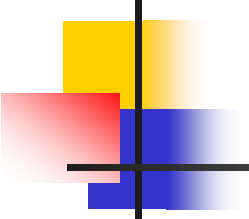

Algorithm: Stage 1

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

$\Sigma = \{50, 100\}$, assume indexed alphabet

Algorithm: Stage 1

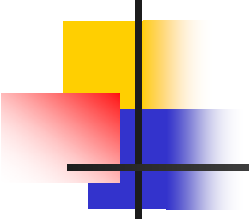

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

$\Sigma = \{50, 100\}$, assume indexed alphabet

$\text{first}[1] = 1$ First occurrence of 50

Algorithm: Stage 1

1	2	3	4	5	6	7	8	9
50	50	100	50	50	50	50	100	50

$\Sigma = \{50, 100\}$, assume indexed alphabet

$\text{first}[1] = 1$

$\text{first}[2] = 3$ First occurrence of 100

Algorithm: Stage 1

$\text{next}[1] = 2$

Next occurrence of $t[1] = 50$

Algorithm: Stage 1

$\text{next}[1] = 2$ $\text{next}[2] = 4$ Next occurrence of $t[2] = 50$

Algorithm: Stage 1

$\text{next}[1] = 2$

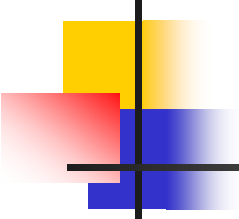

$\text{next}[2] = 4$

$\text{next}[3] = 8$

Next occurrence of $t[3] = 100$

And so on...

Algorithm: Stage 2

1	2	3	4	5	6	7	8	9	10	11	...
100	50	25	25	100	50	15	30	5	30	50	...

S

Consider an S at $t[5]$.

Algorithm: Stage 2

Algorithm: Stage 2

Algorithm: Stage 2

1	2	3	4	5	6	7	8	9	10	11	...
100	50	25	25	100	50	15	30	5	30	50	...

S

Q

Q

$30 + 50 > 50$

So Stop!

Algorithm: Stage 2

Algorithm: Stage 2

So we get a new sequence t' consisting of Q and S

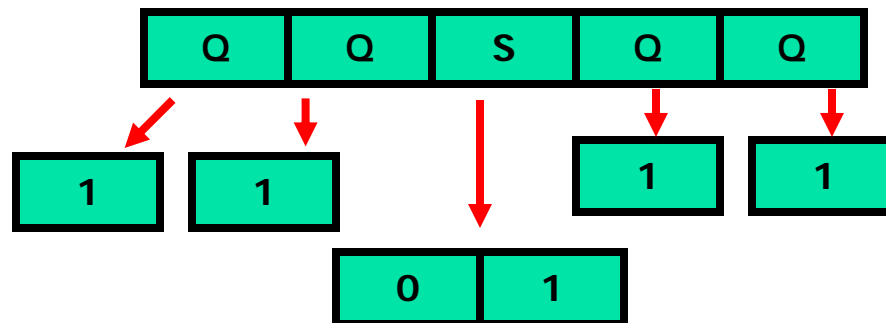

Algorithm: Stage 3

- Here we get t' consisting of Q and S .
- We first want to find the matches of r in t' .
- Define $S_{t'} \equiv S$ in t' , $Q_{t'} \equiv Q$ in t'
- Define $S_r \equiv S$ in r , $Q_r \equiv Q$ in r

Algorithm: Stage 3

- Construct t'' as follows:
 - $S_{t'} = 01, Q_{t'} = 1$
- Construct Invalid set I where I contains the position of 1 due to $S_{t'}$.

Algorithm: Stage 3

- Construct t'' as follows:
 - $S_{t'} = 01, Q_{t'} = 1$
- Construct Invalid set I where I contains the position of 1 due to $S_{t'}$.

No match can occur
at position 4
because it is not a
'real' position in t'

$$I = \{4\}$$

Algorithm: Stage 3

- Construct r' as follows:
 - $S_r = 10, Q_r = 0$

Algorithm: Stage 3

- Construct r' as follows:
 - $S_r = 10, Q_r = 0$

S	Q
---	---

1	2	3
---	---	---

1	0	0
---	---	---

Algorithm: Stage 3

- Find matches of r' in t'' .
 - Perform bitwise or at each position.
 - If the result is all 1 and the position is not in invalid set then a match
 - Otherwise no match

Algorithm: Stage 3

- Find matches of r' in t'' .

$$I = \{4\}$$

Bitwise Or

No Match!!!

Algorithm: Stage 3

- Find matches of r' in t'' .

$$I = \{4\}$$

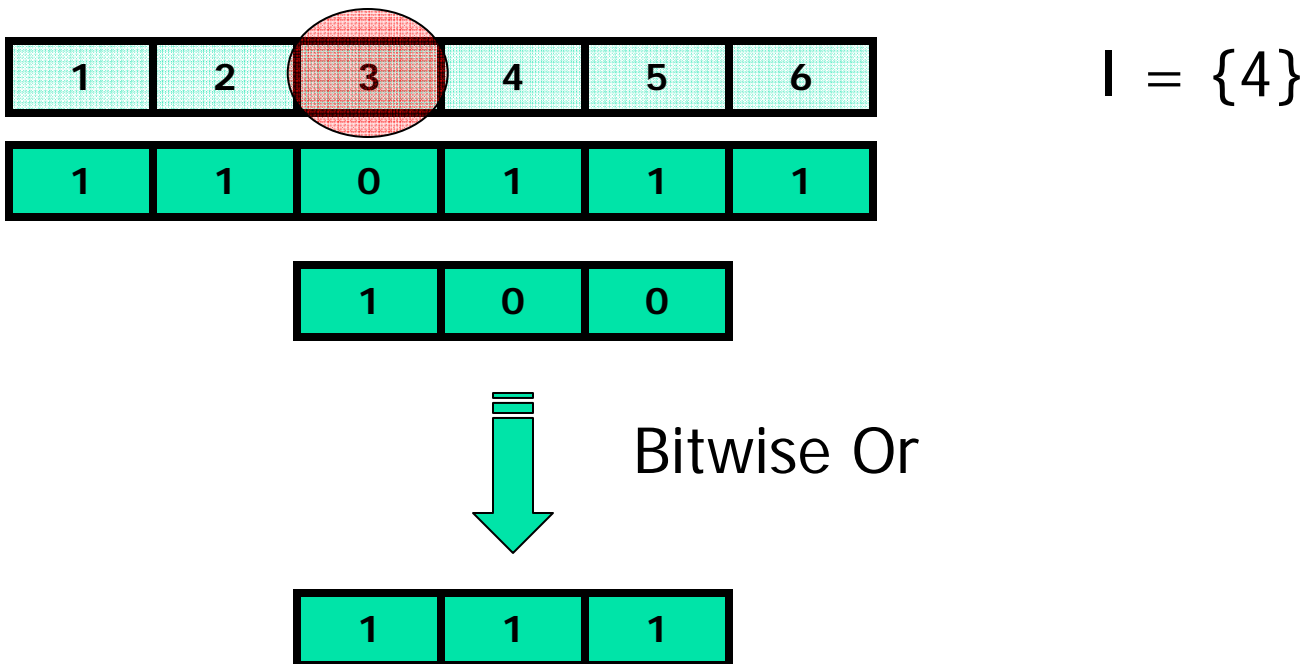

Bitwise Or

No Match!!!

Algorithm: Stage 3

- Find matches of r' in t'' .

All 1's!!! And $3 \notin I$. So a MATCH!!!

Algorithm: Stage 3

- Find matches of r' in t'' .

All 1's!!! But, $4 \in I$. So NO MATCH!!!

Algortihm

- In this way we can find the matches & then we can easily compute the cover

Conclusion

- In practical cases size of the rhythm is 10~13. So we have assumed m to be constant.
- It would be interesting, however, to remove the dependency on m
- It would be interesting to remove the restriction of one S being Solid
- Applying another restriction on the number of additions in the numeric text may turn out to be useful
